Introducing today's project!

What is AWS IAM?

AWS Identity and Access Management (IAM) is a web service that helps you securely control access to AWS resources. With IAM, one can manage permissions that control which AWS resources users can access.

How I'm using AWS IAM in this project

I used AWS IAM as a Service to control who is authenticated (signed in) and authorized (has permissions) to use my account's resources. IAM provides the infrastructure necessary to control authentication and authorization for AWS accounts.

One thing I didn't expect...

I didn't expect to be such an easy task to handle the Authorization to my AWS Resources

This project took me...

This project took me approximately 45 min to go through each and every feature and provide the infrastructure necessary to control the authentication and authorization of my AWS account.

Tags

Tags are like labels you can attach to AWS resources for organization. In this case, we're creating a tag called "Env" with a value of "production" or "development" to label the instances used in production vs development environments.

As mentioned above I tagged "Env" with a value of "production" and another instance "development" to label production and development environments separately.

IAM Policies

"IAM Policies are a set of rules for who can do what with our AWS resources. It's all about giving permissions to IAM users, groups, or roles, saying what they can or can't do on certain resources, and when those rules are being implemented"

The policy I set up

'For this project, I've set up a policy using the JSON method '.....

'I've created a policy that allows some actions (like starting, stopping, and describing EC2 instances) for instances tagged with "Env = development" while denying the ability to create or delete tags for all instances. '

When creating a JSON policy, you have to define its Effect, Action and Resource.

'The Effect, Action, and Resource attributes of a JSON policy means to indicate whether the policy allows or denies a certain action and A list of the actions that the policy allows or denies. Which resources does this policy apply to ! '

My JSON Policy

The screenshot shows the AWS IAM 'Create policy' interface. The left sidebar has 'Step 1: Specify permissions' selected. The main area is titled 'Specify permissions' with a 'Policy editor' sub-section. It displays the following JSON code:

```
1  {
2    "Version": "2012-10-17",
3    "Statement": [
4      {
5        "Effect": "Allow",
6        "Action": "ec2:*",
7        "Resource": "*",
8        "Condition": {
9          "StringEquals": {
10            "ec2:ResourceTag/Env": "development"
11          }
12        }
13      },
14      {
15        "Effect": "Allow",
16        "Action": "ec2:Describe",
17        "Resource": "*",
18        "Condition": {
19          "StringEquals": {
20            "ec2:ResourceTag/Env": "development"
21          }
22        }
23        "Action": [
24          "ec2:DeleteTags",
25          "ec2:CreateTags"
26        ],
27        "Resource": "*"
28      }
29    ]
30  }
```

The right side of the interface includes tabs for 'Visual', 'JSON' (which is selected), and 'Actions'. A sidebar lists 'Included' services like EC2, and 'Available' services like API Gateway, API Gateway V2, ASC, Access Analyzer, and Account. There is also a 'Add a resource' button.

Account Alias

'An account alias is a friendly name for your AWS account that you can use instead of your account ID (which is usually a bunch of digits) to sign in to the AWS Management Console.'

'Creating an account alias took me less than a 30 seconds' ...

'Now, my new AWS console sign-in URL is <https://nxtwork-alias-souradeep2004.signin.aws.amazon.com/console>'.

The screenshot shows the AWS IAM Dashboard. A modal window titled 'Create alias for AWS account 471112875872' is open. In the 'Preferred alias' field, the value 'nxtwork-alias-souradeep2004' is entered. Below the field, a note states: 'Must be no more than 63 characters. Valid characters are a-z, 0-9, and - (hyphen).'. Under 'New sign-in URL', the URL 'https://nxtwork-alias-souradeep2004.signin.aws.amazon.com/console' is displayed. A note below it says: 'IAM users will still be able to use the default URL containing the AWS account ID.' At the bottom of the modal are 'Cancel' and 'Create alias' buttons. To the right of the modal, the 'AWS Account' section shows the 'Account ID' as '471112875872' and the 'Account Alias' as 'Create'. Below that, the 'Sign-in URL for IAM users in this account' is listed as 'https://471112875872.signin.aws.amazon.com/console'. On the left side of the dashboard, there are navigation links for Identity and Access Management (IAM), Access management, Access reports, and Quick Links.

IAM Users and User Groups

Users

'IAM users are the people that will get access to your resources/AWS account, whereas user groups are the collections/folders of users for easier user management. '

User Groups

An IAM user groups are a collection/folder of IAM users. It allows one to manage permissions for all the users in a group at the same time by attaching policies to the group rather than individual users.

'I attached the policy I created to this user group, which means We're adding users to to grant them the permissions associated with that group. This simplifies managing permissions and ensures consistency across users who have similar access'....

Logging in as an IAM User

'The first way is one can view and download the user's password below or email users instructions for signing in to the AWS Management Console. '

'Once I logged in as my IAM user, I noticed that the full access to AWS console was not given so as far as I have noticed there were places where access was denied '...

The screenshot shows the AWS IAM 'Create user' process at step 4, 'Retrieve password'. A green success message at the top states 'User created successfully' and provides instructions to 'View user' or 'Email sign-in instructions'. The main content area displays 'Console sign-in details' including a URL (<https://nextwork-alias-souradeep2004.sigin.aws.amazon.com/console>), a user name ('nextwork-dev-Souradeep'), and a console password ('***** Show'). Navigation links on the left include 'Step 1: Specify user details', 'Step 2: Set permissions', 'Step 3: Review and create', and 'Step 4: Retrieve password'. At the bottom are 'Cancel', 'Download .csv file', and 'Return to users list' buttons.

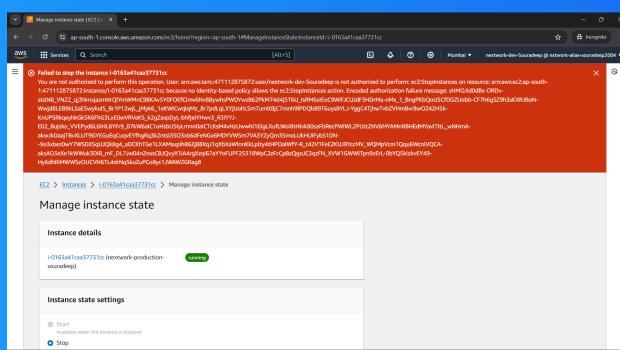

Testing IAM Policies

'I tested my JSON IAM policy by trying to stop the production-LVL-instance which I was not supposed to stop AWS threw an error but The Development level instance stopped as it was mentioned/granted in the IAM Policy '...

Stopping the production instance

'When I tried to stop the production instance AWS prevented the user to stop the instance as there was no permission granted to start/stop an instance of production-level '...

Testing IAM Policies

Stopping the development instance

'Next, when I tried to stop the development instance it stopped as we created an IAM policy which allows the user to start/stop the instances at development-level' ...
